AUTOMATED MICROFLUIDIC DEVICE FOR ANALYTE DETECTION

Tech ID: 18063 / UC Case 2009-064-0

BRIEF DESCRIPTION

Conventional analytical techniques used for detecting specific analytes in a sample often fall short of performance needs for applications that demand high-throughput sample analysis or operate in resource poor settings. These conventional techniques also often require labor-intensive, time consuming, multi-step procedures carried out by trained technicians and are impractical for use in a clinical setting.

UC Berkeley researchers developed an automated multi-dimensional microfluidic device which uses microfluidic technology to streamline all steps needed to obtain mobility and binding-based identity information in one continuous assay. The assays complete in minutes, are readily adaptable to a broad range of multistage assays and are highly sensitive and specific.

SUGGESTED USES

- Rapid and automated bioanalytical separation, identification and quantification
- Multiplex analyte testing (proteins, nucleic acid sequences, biomacromolecules)
- Point of care diagnostics
- High throughput analysis
- Validation and research assays

ADVANTAGES

- Adaptable to detect a wide range of analytes
- Can be used as a rapid western blotting system (assay requires less than 5 minutes) provide large time savings over conventional methods
- Consumes less sample and primary binding member
- Does not require manual intervention and is less labor intensive
- One cohesive device optimized for separation, transfer, dilution and blotting steps
- Simultaneous multi-analyte detection
- Adaptable to many types of diagnostic sample types (e.g., serum, CSF, tissues, saliva, semen)
