

MONOCLONAL ANTIBODIES FOR MOUSE VG3 CHAIN

Tech ID: 18163 / UC Case 1991-025-0

ABSTRACT

Investigators at University of California, Berkeley have identified a hybridoma cell line that produces monoclonal antibodies with specificity for the Vg3 chain of the mouse T cell antigen receptor complex. This gene product is is expressed only in the early fetal thymus. In the adult mouse, Vg3 expression appears to be limited to Thy-1+ cells in the epidermis.
