# Determination of Protein Size

Tech ID: 19561 / UC Case 2003-182-0

# **TECHNOLOGY DESCRIPTION**

This invention teaches the preparation and use of porous Si films containing a controlled distribution of pore sizes for a unique bio-sensing application. Use of this invention to achieve the simultaneous separation and detection of a protein in a nano-machined silicon matrix is described. Gating of the response by adjustment of pH below and above the isoelectric point of the protein has also been demonstrated, and provides an additional means of bio-molecule separation and identification.

This invention is useful for the determination of protein size and for the detection of weakly-bound complexes. In addition, the invention can controllably trap and release proteins from a microporous matrix and is useful for drug delivery applications, as porous Si has been shown to be bio-compatible and readily bio-resorbable.
