

Long Baseline Acoustic Navigation Of Deeptowed And Autonomous Underwater Vehicles

Tech ID: 19927 / UC Case 2005-086-0

TECHNOLOGY DESCRIPTION

UC San Diego inventors have devised a novel method for locating one or more deeptowed or autonomous underwater vehicles during geophysical or oceanographic surveys. The invention has the following features:

- ▶ Works in real time.
- ▶ Saves the time and cost of deploying, navigating, and recovering the seafloor transponder net.
- ▶ Has the navigation array move with the underwater vehicle, rather than remaining stationary.
