(In,Ga,AI)N Optoelectronic Devices with Thicker Active Layers for **Improved Performance**

Tech ID: 23146 / UC Case 2013-329-0

BRIEF DESCRIPTION

A novel invention to enable the fabrication of (In,Ga,AI)N optoelectronic devices with thick active layers containing a

high concentration of indium (In).

BACKGROUND

Currently, the fabrication of heterojunctions for optoelectronic devices is limited to the combination of layers with either the same lattice constants or layers where the thickness of the lattice mismatched layers did not exceed its critical thickness. However, thick active regions are attractive for light emitting diodes (LEDs) with significantly reduced droop and solar cells requiring thick active regions for efficient absorption. Moreover, LED development is restricted by the green gap due to deep green LED sources being difficult to produce.

DESCRIPTION

Researchers at the University of California, Santa Barbara have developed a novel invention to enable the fabrication of (In,Ga,AI)N optoelectronic devices with thick active layers containing a high concentration of indium (In). The In content of the active region can be increased while maintaining a low lattice mismatch between the active region and the current carrying layers, mitigating deterioration of device performance in the green gap. Consequently, relaxed (In,Ga,AI)N films with a lattice constant between GaN and InN can be fabricated on GaN layers of all orientations, including (0001) c-plane GaN.

ADVANTAGES

Improved performance of existing devices which require a combination of layers with large lattice mismatch •

- Mitigation of defect formation in active layers •
- Increase the thickness of the active layers •

ADDITIONAL TECHNOLOGIES BY THESE INVENTORS

- ► Vertical Cavity Surface-Emitting Lasers with Continuous Wave Operation
- Eliminating Misfit Dislocations with In-Situ Compliant Substrate Formation
- Enhanced Light Extraction LED with a Tunnel Junction Contact Wafer Bonded to a Conductive Oxide
- A Structure For Increasing Mobility In A High-Electron-Mobility Transistor
- Ultraviolet Laser Diode on Nano-Porous AlGaN template
- Improved Reliability & Enhanced Performance of III-Nitride Tunnel Junction Optoelectronic Devices
- ► Thermally Stable, Laser-Driven White Lighting Device
- ► GaN-based Vertical Metal Oxide Semiconductor and Junction Field Effect Transistors
- Methods for Fabricating III-Nitride Tunnel Junction Devices
- Contact Architectures for Tunnel Junction Devices
- III-Nitride Tunnel Junction LED with High Wall Plug Efficiency
- ▶ Iii-N Transistor With Stepped Cap Layers
- A Method To Lift-Off Nitride Materials With Electrochemical Etch
- ▶ High-Intensity Solid State White Laser Diode
- Nitride Based Ultraviolet LED with an Ultraviolet Transparent Contact
- III-N Based Material Structures and Circuit Modules Based on Strain Management
