

Revolutionizing Micro-Array Technologies: A Microscopy Method and System Incorporating Nanofeatures

Tech ID: 27531 / UC Case 2009-454-0

SUMMARY

UCLA researchers in the Department of Electrical Engineering have developed a novel lensfree incoherent holographic microscope using a plasmonic aperture.

BACKGROUND

Lensfree imaging has gained interest due to the potential to eliminate bulky optical components and to develop on-chip microscope systems, which would be beneficial for microfluidic systems used in medical diagnostics and cytometry applications. A lightweight and compact, lensfree-imaging modality would also be a cheaper alternative to conventional lens-based microscopy, especially for telemedicine applications. Current imaging modalities that are compact, cost-effective, and easy to use either have poor performance or low resolution, limiting their practical use.

INNOVATION

Researchers led by Professor Aydogan Ozcan have invented a novel lensless incoherent holographic microscope with a resolution of ~500 nm over a field of view (FOV) of ~5 mm² and can achieve subcellular resolution over a large FOV of 24 mm². This compact and lightweight microscope does not require any lenses, lasers, or other bulky optical and mechanical components and instead, utilizes a simple light emitting diode and a compact optoelectronic sensor-array.

APPLICATIONS

- ▶ On-chip microscopy
- ▶ Medical diagnostics
- ▶ Cytometry
- ▶ Telemedicine applications involving global health problems (i.e. malaria, TB, and HIV)

ADVANTAGES

- ▶ Minimally trained personnel to operate
- ▶ Subcellular resolution with large FOV
- ▶ Compact, cheap, and lightweight
- ▶ Lensfree holographic imaging
- ▶ Does not need lenses, lasers, or bulky components

PATENT STATUS

Country	Type	Number	Dated	Case
United States Of America	Issued Patent	9,202,835	12/01/2015	2009-454
