CRISPR-CAS EFFECTOR POLYPEPTIDES AND METHODS OF USE THEREOF (“CAS-OMEGA”)

Tech ID: 32114 / UC Case 2021-018-0

PATENT STATUS
Patent Pending

BRIEF DESCRIPTION

CRISPR-Cas systems include Cas proteins, which are involved in acquisition, targeting and cleavage of foreign DNA or RNA, and a guide RNA(s), which includes a segment that binds Cas proteins and a segment that binds to a target nucleic acid. For example, Class 2 CRISPR-Cas systems comprise a single Cas protein bound to a guide RNA, where the Cas protein binds to and cleaves a targeted nucleic acid. The programmable nature of these systems has facilitated their use as a versatile technology for use in modification of target nucleic acid.

UC Berkeley researchers have discovered a novel family of proteins (CasOmega) that utilize a guide RNA to perform RNA-directed cleavage of nucleic acids. Viral and microbial (cellular) genomes were assembled from a variety of environmental and animal microbiome sources, and variants of a novel and previously unknown Cas protein family were uncovered from the sequences decoded.

SUGGESTED USES

» gene editing of bacterial, archaeal, and eukaryotic cells
» transcription repression of specific genes using inactivated CasOmega
» targeting of proteins bound to CasOmega to a specific locus of a genome
» diagnostic applications via trans-cleavage activity
