Generating Visual Analytics And Player Statistics For Soccer

Tech ID: 32683 / UC Case 2018-549-0

PATENT STATUS

Country	Type	Number	Dated	Case
United States Of America	Issued Patent	12,046,038	07/23/2024	2018-549

FULL DESCRIPTION

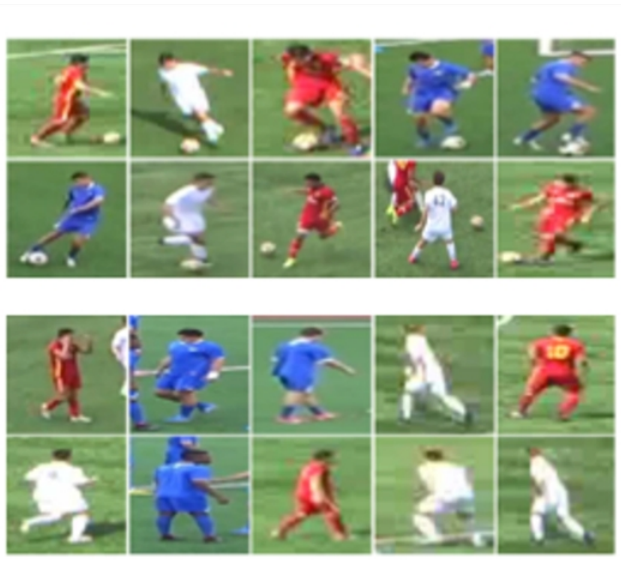
Background

Identification of next generation sports stars is an important responsibility of a coach. Talent identification has been traditionally based on viewing athletes in a trial game or training session environment. A coach's subjective preconceived notion of the ideal player may result in misjudgments and inconsistencies. In team-based sports, such as soccer, talent identification is a complex process due to different qualities associated with performance including personal and tactical attributes.

Current Invention

Researchers led by Prof. Bir Bhanu at UCR have designed a patent pending system to automate talent identification by generating visual analytics and player statistics for soccer from a video using traditional machine learning algorithms and deep learning techniques for computer vision. Specifically, they have developed:

- An approach to generate player analytics and statistics from videos of soccer matches.
- Convolutional Neural Networks for dynamic identification of players controlling the ball.
- Strategy to train Generative Adversarial Networks to augment and improve the performance of the system.
- Generalizable approach for use during different scenarios of the game.



Example scenarios of players with and without the ball

ADVANTAGES

The system and approach that the inventors have developed, now provides:

- An approach to generate player analytics and statistics from videos of soccer matches.
- Convolutional Neural Networks for dynamic identification of players controlling the ball.
- Strategy to train Generative Adversarial Networks to augment and improve the performance of the system.
- Generalizable approach for use during different scenarios of the game.

SUGGESTED USES

- Video analytics in sports
- Talent identification in sports
- Player development in sports
- Game strategy development in Soccer

STATE OF DEVELOPMENT

Proof of concept prototype developed and tested. The testing displays an impressive 92.57% ± 2.92% accuracy in identifying teams. For player analytics their accuracies were, in each case:

- 84.73% - for easy scenarios - 4 – 5 players spread wide apart, e.g., in the defense zone.
- 79.82% - for moderate scenarios - 6 – 10 players in the midfield.
- 67.28% - for hard scenarios - more than 10 players in a small area - e.g., during an attempt at a goal.
