

# Spatial Analysis of Multiplex Immunohistochemical Tissue Images

Tech ID: 33565 / UC Case 2024-532-0

# ABSTRACT

Researchers at the University of California, Davis have developed a semiautomated solution for identifying differences in tissue architectures or cell types as well as visualizing and analyzing cell densities and cell-cell associations in a tissue sample.

#### **FULL DESCRIPTION**

This semiautomated system offers a simplified and powerful solution for tissue imaging analysis. It allows a user to visualize cell density in a tissue sample and can analyze cell-to-cell associations within the tissue sample. It works seamlessly with pre-classified tissue images from various imaging platforms, thereby streamlining the analysis process and enriching research outcomes. Moreover, the system provides a hexagonal heatmap which provides the user with an easy visual representation to evaluate and enhance the understanding of tissue pathology.

#### **APPLICATIONS**

- ▶ Beneficial for researchers and scientists in biomedical research and pathology
- ▶ Can be utilized in clinical applications and labs for detailed tissue analysis
- Potential tool for pharmaceutical companies in drug development and personalized medicine

## **FEATURES/BENEFITS**

- Highly adaptable with various tissue imaging techniques
- Streamlines the analysis process by working with pre-classified tissue images
- Capable of visualizing and quantifying tissue imaging analysis as micro-lesional cell densities
- ▶ Enables detailed analysis of cell-cell associations within tissue micro-lesions
- ▶ Tool to compare cell densities and spatial distribution within different tissue lesions
- Addresses limitations of simple imaging analysis in multiplex studies
- Provides nuanced understanding of cell distribution within specific lesions Avoids misinterpretations due to sparse or dense target cell populations within the tissue

## **PATENT STATUS**

Patent Pending
