ABSTRACT

Researchers at the University of California, Davis have developed method for separating quasi-periodic mixed-signals using a single data trace, enhancing wearable sensor applications.

FULL DESCRIPTION

Deep Harmonic Finesse (DHF) is a method designed to address the challenges of separating quasi-periodic, non-stationary signals from a single mixed signal input. This technology is pivotal for wearable systems where collecting large datasets is impractical. By leveraging deep harmonic neural networks and a pattern alignment method, DHF can isolate target signals from noise and other quasi-periodic phenomena, leveraging prior knowledge of time-frequency patterns. This approach is particularly beneficial in applications such as tissue oximetry and blood glucose monitoring, where accurate signal separation can significantly enhance the reliability of sensor readings.

APPLICATIONS

- Wearable health monitors for blood glucose levels, tissue oximetry, and more.
- Non-invasive fetal monitoring and other deep tissue sensing applications.
- Signal processing solutions where data collection is challenging or impractical.

FEATURES/BENEFITS

- Enables signal separation using only a single data trace, overcoming the need for large datasets.
- Addresses the overlap of signal frequencies, a limitation of traditional frequency-based filtering techniques.
- Incorporates a deep harmonic neural network with pattern alignment for improved signal accuracy.
- Significantly improves signal-to-distortion ratio and mean squared error compared to existing methods.
- Enhances the reliability of wearable sensor applications in healthcare, such as non-invasive fetal monitoring.
- Separates quasi-periodic signals in the presence of frequency overlap and limited data availability.
- Accurately detects physiological parameters in wearable systems amidst noisy and complex signal environments.
- Reduces the need for extensive data collection in wearable healthcare monitoring systems.

PATENT STATUS

Patent Pending

ADDITIONAL TECHNOLOGIES BY THESE INVENTORS

- Fetal Oximetry Measurement via Maternal Transabdominal Spectroscopy
