Oxyfluoride Phosphors for Use in White Light LEDs

Tech ID: 23416 / UC Case 2009-704-0

BRIEF DESCRIPTION

A novel Ce³⁺-doped oxyfluoride phosphor material for solid-state lighting applications.

BACKGROUND

White light generation for most commercial light emitting diode (LED) lamps employ yellow Ce³⁺ phosphors excited by blue InGaN diodes due to their unsurpassed efficiency. However, the Ce³⁺ phosphors have relatively weak emissions in the red region. Moreover, the color output from these phosphors is strongly dependent on temperature and current, creating problems for high power LEDs.

DESCRIPTION

Researchers at the University of California, Santa Barbara have invented a novel Ce³⁺-doped oxyfluoride phosphor material for solid-state lighting applications. This invention produces much higher photoluminescence intensities than commercial Ce³⁺, allowing for tunability of emission color and excitation band, resulting better light quality with high efficiency. Moreover, this material can be used for white light generation with a number of phosphor combinations (near UV light with red, green-orange or yellow phosphors) and allows for greater color rendering.

ADVANTAGES

• High efficiency

• Good color rendering properties
• Variety of applications

APPLICATIONS

• LEDs
• Liquid Crystal Displays
