Fully Automated Multi-Organ Segmentation From Medical Imaging

Tech ID: 33455 / UC Case 2020-303-0

BRIEF DESCRIPTION
A comprehensive method for automated multi-organ segmentation based on deep fully convolutional networks and adversarial training, achieving superior results compared to existing techniques.

APPLICATIONS
- Improvements in medical imaging technology
- Integration into AI-based diagnostic systems
- Enhancements in research applications requiring organ segmentation

ADVANTAGES
- Utilizes fully convolutional networks and adversarial training
- Offers a fully automated system, reducing the need for human intervention
- Provides superior results, as demonstrated by high Dice metrics

Problems Solved:
* Solves the problem of time-consuming and error-prone manual multi-organ segmentation
* Improves upon the accuracy limitations of existing automated methods

DESCRIPTION
This technology offers a fully-automatic method for multi-chamber segmentation, utilizing deep fully convolutional networks and adversarial training. The system was successfully tested on 20 echocardiograms from 100 patients for training and validation, outperforming state-of-the-art techniques with significantly improved Dice metrics.
